Logo System Reference *e* Variations

A catalog of the current logo marks, corrected file variations, new applied composites, and mock-ups — prepared for reference and for the GitHub repo.

Two directions on the table

The original full-color icon versus the minimalist line-art proposal. Both are shown at equal size for a direct comparison.

Note on brand fit: the gradient version's blue-to-teal glow and 3D-ish shading lean toward a generic tech/AI-startup register — closer to Hero/Magician energy than the locked Sage + Caregiver archetype. The minimalist line-art version reads calmer and more considered, which is a better match for a "diagnosis before prescription" brand. This is a recommendation, not a decision — flagging it here so it's made consciously rather than by default.

Color mismatch worth resolving: both marks are built in navy/teal (approx. #011841), which does not match the warm ink / cream / clay coral / deep ochre / mist slate palette already locked for the website and content system. Before this logo is finalized, the team should decide: recolor the logo into the warm palette, or treat navy as a fifth "brand-mark-only" color that sits outside the content palette. Left unresolved, the logo and the website will visually read as two different brands.

Horizontal, vertical, and icon-only

Every combination currently produced: standard (navy on light) and inverted (white on navy), across horizontal, vertical, and icon-only formats.

HORIZONTAL — STANDARD

HORIZONTAL — INVERTED

VERTICAL — STANDARD

VERTICAL — INVERTED

ICON ONLY — NAVY, TRANSPARENT

ICON ONLY — WHITE, TRANSPARENT

One asset was broken — now fixed

Before cataloging, each "transparent" file was checked for real alpha transparency rather than just a checkered preview.

What was wrong: the black icon-only file (ChatGPT_Image_Sep_13_11_52_30_AM.png) looked transparent in preview, but was actually a flat RGB image with a checkerboard pattern drawn into the background pixels. Dropped onto a colored background as-is, it would have shown a visible gray-and-white checker square behind the mark. It's been rebuilt here with genuine alpha transparency by thresholding on luminance — the good news is the underlying linework itself was clean, so nothing had to be redrawn.

Small-size legibility test — the same navy icon at 64px, 48px, 32px, 24px, and 16px:

Real problem worth flagging: at 32px and below — favicon size, app-icon size, and how a social avatar actually displays in a feed — the internal detail (speech-bubble dots, network nodes, the circuit lines) collapses into a gray blob. The mark is legible at profile-picture-on-a-website size, but not at the sizes it will actually be used most often. A simplified, detail-reduced version of the icon is worth commissioning specifically for small-size use before this becomes the production favicon/app icon.

Additional composites built from the icon

Derived directly from the corrected icon file — no new artwork invented, just legitimate production variants a dev or designer will actually need.

Icon recolored against the locked website palette, to actually test the fit named on the previous spread:

Reading on this test: the icon recolors cleanly into ink or coral and holds up fine visually — the linework itself isn't tied to navy. That's good news: if the team decides to reconcile the logo with the warm palette, it's a recolor job, not a redraw.

Strategic Social Intelligence — Proposal / Diagnosis Summary

Quick usage guidelines

CONTEXT	USE
Light background	Standard navy lockup / icon
Dark or navy background	Inverted white lockup / icon
Favicon / app icon / small avatar	Icon only — pending a simplified small-size version (see QC page)
Narrow horizontal space (email header, nav bar)	Horizontal lockup
Square/stacked space (social profile, cover slide)	Vertical lockup

Don't

- Stretch or distort the icon or wordmark
- Recolor the mark outside the approved variants until the palette question (page 01) is resolved
- Place the navy icon on a mid-tone background where contrast drops below AA-readable
- Use the icon-only mark below 32px until a simplified small-size version exists

This reference catalogs what currently exists plus derived production variants. It is not a final, locked brand guideline — the palette-alignment and small-size-legibility questions on pages 01 and 03 should be resolved before this becomes the production logo package.
